General Powerlouver Window checks:

- Operate the Powerlouver Windows for at least 10 seconds as the Powerlouver Motors can turn for a few seconds before the window begins to open and, similarly, can continue to turn for a few seconds after the window is fully closed.
- Check that nothing is obstructing the movement of the blades.
- Ensure that there is no excessive grime or salt built up on the window. If so the window should be washed.
- In extreme cold conditions the blades may freeze together. Defrost the blades before trying to open the window.

General Apptivate Control Unit problem solving:

- Power cycling (turning the power to the Apptivate Control Unit off, and then waiting 60 seconds before turning the power back on) will re-start the processors in the Apptivate Control Unit and thereby resolve many problems.
- If power cycling does not resolve an issue, a factory reset will restore the Apptivate Control Unit to its original settings.
The Apptivate Control Unit is not responding when touched:

- Touch within the outlines of the buttons.
- Touch with bare skin (e.g., it will not sense touches from a gloved hand).
- Turn off power (unplug transformer or turn off at distribution board) wait 60 seconds for charge to dissipate, then turn power on again (plug transformer back in) to make the Apptivate Control Unit re-calibrate its touch sensitivity.
- **WARNING:** THIS CHECK SHOULD ONLY BE PERFORMED BY QUALIFIED SERVICE PERSONNEL AND ONLY AFTER CONFIRMING THAT THE APPTIVATE CONTROL UNIT HAS NOT BEEN MISTAKENLY CONNECTED TO 110V AC POWER. Unscrew the Apptivate Control Unit from the wall and check whether all 5 diagnostic LED lights are lit or flashing. There are 3 lights on the bottom (indicating touch sensors and the Bluetooth module) 2 of which should be flashing, and 2 lights on the side (indicating that 24 v DC power is being supplied). Note: these LED lights may be red, blue or green.
The Apptivate Control Unit is not responding (or responding erratically) when touched, but does respond to the Powerlouver App:

- There is a known incompatibility between a particular range of AC to DC transformers from Meanwell. These models output a higher than normal level of electronic 'noise' which interferes with the touch sensors on the Apptivate Control Unit.
- The Meanwell transformers (generally outputting 1.67 or 3.75 amps) should be replaced with different transformers.
- Breezway supplies a 2.0 amp transformer which is fully compatible with the Apptivate Control Unit.
The Powerlouver Windows open when I touch ‘Close’ and close when I touch ‘Open’:
- The wiring from the Apptivate Control Unit to the Powerlouver windows has been incorrectly connected.
- After turning power off, swap the wires connected to the affected ‘Motor Group’ output from the Apptivate Control Unit (indicated below by the red and green arrows).

The Powerlouver Windows do not open halfway when I touch ‘Inter’:
- The Apptivate Control Unit calibrates the ‘Inter’ position by timing how long it takes for the connected Powerlouver Motors to move from the fully open to the fully closed position.
- Perform a factory reset (see the end of this document for instructions on how to perform a factory reset).
- Allow the Apptivate Control Unit to calibrate the ‘Inter’ position by fully opening and fully closing the connected Powerlouver Windows a number of times:
  - Touch ‘Open’ and allow the Apptivate Control Unit to fully open the connected Powerlouver Windows.
  - Touch ‘Close’ and allow the Apptivate Control Unit to fully close the connected Powerlouver Windows.
  - Touch ‘Open’ and again allow the Apptivate Control Unit to fully open the connected Powerlouver Windows.
  - Touch ‘Close’ and again allow the Apptivate Control Unit to fully close the connected Powerlouver Windows.
The Powerlouver Windows open or close without any buttons on the Apptivate Control Unit being touched:

- The Apptivate Control Unit may be operating the Powerlouver Windows in response to pre-set timer events or in response to temperatures.
  - If the LED lights on the ‘Timer’ or ‘Temp’ buttons are lit then the Apptivate Control Unit is in a mode where it will operate the Powerlouver Windows automatically.
  - When automatically operating in response to a timer event or to a temperature reading, the ‘Timer’ or ‘Temp’ LED light on the Apptivate Control Unit will flash. Eg: If a timer is set to open the Powerlouver windows at 10:00am, the LED light on the ‘Timer’ button will be lit up until 10:00am at which point the ‘Open’ LED light will be lit and the ‘Timer’ LED light will flash while the window opens. Once open, the ‘Open’ LED light will turn off and the ‘Timer’ LED light will stop flashing and will remain lit until the next timer event, or until the timer mode is turned off.

- Check the version of the firmware controlling the touch panel, newer firmware may resolve the issue.
  - In the menu, touch the ‘About’ icon and then the ‘Technical’ button in the bottom right corner of the ‘About’ page.
  - The version numbers of 4 parts of the hardware and firmware of each Apptivate Control Unit are listed.
  - Scroll to the Apptivate Control Unit which is operating without being touched and without being in an Auto Control mode and check the number in the ‘STM8’ line.
  - If the STM8 number is lower than <00150902> for dual channel models, or lower than <00160607> for single channel models, the newer version of the STM8 firmware should resolve the problem. The Apptivate Control Unit should be returned to Breezway.
Apptivate Control Unit is not visible in the Powerlouver App, or the Powerlouver App cannot be installed:

- The Apptivate Control Unit may not have been associated to the Powerlouver App:
  - Touch the menu icon (AKA the ‘hamburger’ icon), then select “Add/Remove”, hold the smart device next to, and within 10 cm of, the Apptivate Control Unit. The Apptivate Control Unit should appear below the heading “Add device” with a green ‘Add’ button next to it. Touch the green ‘Add’ button.
  - If the Apptivate Control Unit has already been associated to another Powerlouver App, an access code may be required to complete the association.

- The smartphone may not be compatible:
  - Check that the smart device has a ‘Bluetooth Smart’ chip (check with supplier or manufacturer of device). Compatible devices include:
    - Apple iPhone 4s and newer
    - Apple iPad 3 and iPad Mini and newer
    - Apple iPod Touch 5
    - Samsung Galaxy range
    - HTC One, HTC Max
    - Sony Experia range
    - Droid RAZR, Ultra, Maxx, Mini
    - Google Nexus 4, Nexus 5, Nexus 7 and Nexus 10
  - Check that the operating system is compatible (iOS7 or newer or Android 4.3 or newer).
  - Check that Bluetooth is switched on, on the smart device.
  - Check that the Powerlouver App has been installed.
The Apptivate Control Unit is visible in the Powerlouver App, but will not respond:

- Check that Bluetooth is switched on, on the smart device.
- Touch a button on the Apptivate Control Unit to confirm whether power is being delivered to the Apptivate Control Unit. If power is being delivered the button light should light up when touched.
- Move closer to Apptivate Control Unit to bring smartphone within range.
- If multiple smartphones are associated to the Apptivate Control Unit, ensure that the Powerlouver App is not open on the other devices as a Bluetooth connection can only be maintained between the Apptivate Control Unit and a single Powerlouver App at a given time.
- On the ‘Home’ screen of the Powerlouver App, touch the screen and drag your finger down as if scrolling through the Apptivate Control Units shown on the ‘Home’ screen. This will make the Powerlouver App rescan for Apptivate Control Units associated to it.
I've forgotten the access code of an Apptivate Control Unit:

- From the ‘Home’ page of the Powerlouver App, touch the name of the Powerlouver Control Unit to get to the ‘Detailed view’, then touch the ‘Settings’ icon at the top of the screen. Re-set the Access Code.
- Perform a factory re-set (instructions provided later in this document).

The Powerlouver App crashes frequently:

- Ensure that the latest version of the Powerlouver App is installed:
  - Visit the App Store (on Apple devices) or the Google Play Store (on Android devices) and check whether any updates are available.
  - On Android devices, an updated version of the Powerlouver App was launched to the Google Play Store in June 2016, replacing the “Powerlouvre App”. Ensure that the “Powerlouvre App 2.0” is installed.
The ‘Timer’ and/or ‘Temp’ LED lights on the Apptivate Control Unit are so bright that they interfere with my sleep:

- From the ‘Home’ page, touch the name of the Apptivate Control Unit to get to the ‘Detailed view’, then touch the ‘Settings’ icon at the top of the screen. Turn the ‘Sleep mode’ on and use the slider to set the brightness of the LEDs. Night mode is automatically activated between 10pm and 7am.
The window opens and closes frequently in the ‘Temp’ mode:

- From the ‘Home’ page, touch the name of the Apptivate Control Unit to get to the ‘Detailed view’, then touch the words ‘Temperature Set’ to set the temperature above which the windows will automatically be opened and the temperature below which the window will automatically be closed. When the windows open to allow cooling ventilation the indoor temp will drop by a few degrees, if the open and close temperatures are too close this will cause the windows to open and close frequently as the indoor temperature rises and falls and rises again. So ensure that the open and close temperatures are different by a few degrees.
The timers are not operating at the times I set:

- If there has been an interruption to the power supplied to the Apptivate Control Unit (e.g., a power failure, or the safety switch on the distribution board has been tripped) the Apptivate Control Unit will be aware that its internal clock will not have been advancing during the period it had no power and its timers will therefore be out of time.
- The Apptivate Control Unit will re-set its time from the first Powerlouvre App which connects to it and continue as normal.
- If the Apptivate Control Unit was in timer mode when power was lost, when power is restored the timer mode will be deactivated. If the Timer button on the Apptivate Control Unit is touched it will flash to indicate that the Apptivate Control Unit's internal clock is out of time and will not allow Timer mode to be activated. Opening the Powerlouvre App to allow it to connect to the Apptivate Control Unit will re-set the time on the Apptivate Control Unit and return it to normal functioning.

The Apptivate Control Unit will not fully open (or fully close) the connected Powerlouvre Windows:

- The Apptivate Control Unit monitors the current being drawn by the connected Powerlouvre Windows. Every time the Powerlouvre Windows are opened or closed, the Apptivate Control Unit measures how long current is drawn for before the Powerlouvre Windows are stopped by touching a button on the Apptivate Control Unit or by the Powerlouvre Windows reaching the fully open or fully closed position.
- If the Powerlouvre Windows are stopped before reaching the fully open or fully closed position (for example by a physical obstruction), then the Apptivate Control Unit may stop the Powerlouvre Windows in the position in which it was previously stopped as it mistakenly believes that the Powerlouvre Window is fully open (or fully closed).
- A factory re-set must be performed.
Factory re-set:

- A factory reset will delete all associations with Powerlouver Apps, timer events, customised temperature settings and customised naming of the Apptivate Control Unit.
- Remove the front cover of the Apptivate Control Unit, use straightened paperclip to push the re-set button (bottom left, near screw head). When pushed, the reset button will cause all lights on the Apptivate Control Unit to light up. Push and hold the reset button until all the LED lights on the ACU begin flashing to indicate that the factory reset has been completed. Snap the cover plate back on. Wait 60 seconds for the touch sensitivity re-calibration to be completed.
- If the Access hole to the factory reset button is blocked, the factory reset button can be accessed by removing the Apptivate Control Unit from the wall. NOTE: THIS SHOULD ONLY BE PERFORMED BY QUALIFIED SERVICE PERSONNEL AND ONLY AFTER CONFIRMING THAT THE APPTIVATE CONTROL UNIT HAS NOT BEEN MISTAKENLY CONNECTED TO 110V AC POWER.
- After a factory reset has been performed the Powerlouvre Window should be fully opened and fully closed a number of times to re-calibrate the fully open, fully closed and intermediate open positions.
The Apptivate Control Unit seems fine, but the Powerlouver Window does not operate:

- The Apptivate Control Unit distributes power to the attached Powerlouver Windows.
- Check for breaks in the wiring between the Apptivate Control Unit and the attached Powerlouver Windows.
- If some bays within a Powerlouver Window operate and some do not, please contact the supplier of the window to check for faults in the internal wiring of the window.
